

HTML & CSS Basics — Assignment 02

Continuation Assignment | Beginner Level

Topics Covered: CSS Selectors, Colors, Typography, Box Model, Display, Positioning, Units, Flexbox

Previous Assignment: HTML Basics — Assignment 01

Important Instructions

- This assignment is a continuation of your previous HTML assignment.
- For Questions 1–4, use the same HTML files/webpages that you submitted in Assignment 01 and apply CSS to them. Do not create completely new webpages for Questions 1–4.
- For Question 5, create both the HTML and CSS from scratch.
- Use CSS only for styling. Do not use JavaScript.
- Use the CSS concepts taught in class and keep your HTML/CSS properly organized and indented.
- Do not use Bootstrap, Tailwind, or any other CSS framework.
- Students should be able to explain the CSS they have written.

Question 1 — Style Your “My Introduction” Page

Previous HTML Submission: Take your **introduction.html** file from Assignment 01 and improve its appearance using CSS.

For this question, demonstrate **Inline CSS, Colors, Typography, and Selectors**.

- Add inline CSS to the main `<h1>` to change its text color and font size.
- Add an internal `<style>` section inside the `<head>`.
- Using CSS selectors, style all `<h2>` elements, `<p>` elements, the unordered list, and the ordered list.
- Apply different text colors, font sizes, font families, and text alignment.
- Use at least one class selector and one ID selector.
- Use different CSS units such as px, %, and rem.

Important: Demonstrate that you understand the difference between Inline CSS, Internal CSS, and CSS selectors.

Question 2 — Style Your “My Favorite Websites” Page

Previous HTML Submission: Take your **websites.html** file from Assignment 01 and style it using an **external CSS stylesheet**. Create **websites.html** and **websites.css**.

- Style the main heading using an appropriate selector.
- Style all website links with a different text color, suitable font styling, and a non-default link appearance.
- Add a background color to the webpage.
- Style the image using the Box Model: width, height, padding, border, and margin.
- Give the image rounded corners using `border-radius`.
- Create a styled container around the website links.
- Use `display` to change how the links are displayed, such as `block` or `inline-block`.
- Use appropriate CSS units such as px, %, or rem.

Question 3 — Style Your “Student Marks” Table

Previous HTML Submission: Take your **marks.html** file from Assignment 01 and apply CSS to make the table look professional. You may create an external stylesheet called **marks.css**.

- Style `<table>`, `<caption>`, `<th>`, and `<td>`.
- Add a background color for the table header and different styling for table data cells.
- Add borders around the table/cells.
- Use proper padding and margin.
- Apply appropriate font sizes and text alignment.
- Use at least three selector types, such as element, class, and ID selectors.
- Use a CSS selector to apply a different style to the Total column.

Question 4 — Style Your “Student Registration Form”

Previous HTML Submission: Take your **registration.html** file from Assignment 01 and apply CSS to make it look like a clean student registration form.

Focus particularly on **Flexbox**, **Display**, **Box Model**, **Typography**, and **Positioning**.

- Create a separate external stylesheet: **registration.css**.
- Create a main form container and use the Box Model to add width, padding, margin, and border.
- Style labels, text inputs, email input, password input, date input, radio buttons, checkboxes, select dropdown, textarea, submit button, and reset button.
- Use Flexbox to arrange at least one part of the form, such as gender options, programming-language checkboxes, or buttons.
- Use display appropriately for form elements.
- Use different colors for the form background, input fields, buttons, and headings.
- Apply font family, font size, font weight, and text alignment.
- Use at least one CSS positioning property, such as `position: relative` or `position: absolute`.
- Use appropriate CSS units such as `px`, `%`, `rem`, or `vh/vw`.

Expected Result: The final form should look substantially different from the browser's default HTML form.

Question 5 — Build a Complete Personal Profile Page

New HTML + CSS Task: Unlike Questions 1–4, this webpage was NOT part of Assignment 01. Create both the HTML and CSS from scratch.

Create **profile.html** and **profile.css** for a Personal Profile / Student Portfolio page.

HTML Requirements

- Use `<header>`, `<nav>`, `<main>`, `<section>`, `<article>`, `<aside>`, and `<footer>`.
- Header: your name and a short title such as “Aspiring Web Developer”.
- Navigation: at least 3 links.
- About section: your image, a heading, and a short introduction paragraph.
- Skills section: at least 5 skills.

- Article: “My Journey into Web Development” with at least one paragraph.
- Aside: additional information such as hobbies, favorite technology, or career goal.
- Footer: your name, copyright text, and at least one contact link.

CSS Requirements

- Selectors: use element, class, and ID selectors.
- Colors: apply colors to the page background, header, navigation, sections, text, and buttons/links.
- Typography: apply font family, font size, font weight, text alignment, and appropriate line height.
- Box Model: apply margin, padding, border, width, and height where appropriate.
- Display: use at least one appropriate display property.
- Positioning: use relative or absolute positioning somewhere on the page.
- Units: use at least three different units, such as px, %, rem, vh, or vw.
- Flexbox: use Flexbox as the primary layout method for at least one major section, using properties such as display:flex, justify-content, align-items, gap, and flex-direction.

Question 6 — Recreate the Given Webpage Using Flexbox

Design the webpage shown below as closely as possible using HTML and CSS, using **Flexbox** and the CSS concepts taught in class.

Submission Requirements

Submit your complete project folder with the following structure:

```
HTML-CSS-Assignment/  
■■■ introduction.html  
■■■ websites.html  
■■■ websites.css  
■■■ marks.html  
■■■ marks.css  
■■■ registration.html  
■■■ registration.css  
■■■ profile.html  
■■■ profile.css  
■■■ flexbox.html  
■■■ flexbox.css  
■■■ images/
```

Main Learning Objective

By completing this assignment, you should be able to take a basic HTML webpage and transform it into a properly structured and visually styled webpage using CSS selectors, colors, typography, the box model, display, positioning, units, and Flexbox.
